TIRA Vibration Test Systems - Inertial systems

## Inertial systems from 125 N to 650 N

TIRA produces inertial systems (IN) in the range from 125 N to 650 N , which can be bolted directly to the structure and aligned at any angle within $360^{\circ}$.

The generators have an excellent lateral and axial stiffness. Excitation is made by permanent magnets, and a special spring system provides optimal guidance so that the full body mass can impact on the structure.

The generator is cooled by a maintenance-free fan, with cooling air entering through a filter assembly. As inertial generators from TIRA can efficiently apply dynamic forces to large structures, they have found their applications in manufacturing, aerospace, buildings, civil engineering and shipbuilding.
